

(57) Abstract:

A method for setting up redirection of contacts coming to a terminal (A) to at least one other communication system (A'), which is advantageously located outside the mobile communication network so that a proposal of and address of a other communication system (A') is sent by utilizing the data transmission connection set up between the terminal (A) and the first communication system (S) to the terminal (A), whose acceptance of the proposal is followed by the activation of the redirection.
